

The task is to create a datatable to show upcoming sport games.

1. Set up fake json server with extension: <https://github.com/typicode/json-server>
2. Make it serve the json file attached.

Example request: `http://localhost:3000/games?_page=7&_limit=20`

Display 20 bets on each page.

Make a pagination feature which has to satisfy following:

- Previous button should be shown only if user is on a page which is after the first page.
- Next button should be shown only if user is on a page which before the last page
- Must contain number reference to the first and last page.
- Current page can't be clicked.
- Before and after current page there should be 1 clickable number which takes user to previous and next page (if possible).
- Tree dots (...) shown whenever there are 1 or more numbers not visible.

Example:

If there are 24 pages, pagination should look like this:

(black color suggests that element is not clickable)

If user is on page 1:

1 2 ... 24 next

If user is on page 3:

previous 1 2 3 4 ... 24 next

If user is on page 10:

previous 1 ... 9 10 11 ... 24 next
